Your laptop. Real AI. Governed.

SLINGSHOT 2026 | Agentic & Autonomous Systems | Advanced Computing and Intelligence

Pointer by Netie

Pointer by Netie | SLINGSHOT 2026 | Advanced Computing & Intelligence

The problem

- Laptop work is still manual: copy-paste, forms, video edits, meeting notes.
- Chatbots advise but cannot safely operate the apps people already use.
- Ungated computer-use agents risk silent spend, delete, send, or secret leakage.
- Cloud dictation and copilots miss SEA multilingual reality (EN / MS / ZH) and audit need
- SMEs need an AI coworker on the screen - with human approval, not reckless autonomy

The solution: Pointer by Netie

- Windows screen agent: sees the desktop, hears meetings, and acts with approved clicks
- Everyday automation: create/edit video workflows, draft words, copy-paste, fill, save.
- Clicky mode: cursor becomes the agent; Frame drag lets AI target exactly what you mean
- Agent / Transcribe / Meeting modes in one tray-first HUD - built for real laptops.
- Governed by Cortex: fail-closed gates, action tiers, kill switch, tamper-evident audit.

How it works

- Perceive: region vision + on-device Whisper STT (mic + system audio loopback).
- Plan: Cortex intent + recipes; on-screen text treated as data, not commands.
- Gate: READ auto; CONSEQUENTIAL needs nod/Affirm; PROHIBITED refused; secret
- Act: real Win32 input (click, type, scroll, drag) with step limits and verify loops.
- Learn: personal brain on device; optional dual-envelope fleet learning - no key sprawl.

Deep tech differentiation

- Agentic computer-use stack: perception + planning + governed execution on Windows
- Safety as product: injection-aware screen text, fail-closed when Cortex is down.
- Edge-first speech for Malaysian/Singapore multilingual meetings.
- Dual-brain architecture: local personal memory + optional shared improvement envelope
- Reference consumer of Cortex (Netie Engine) - not another chat wrapper.

Market & beachhead

- TAM: global AI agents / intelligent process automation ~USD 20B+ category.
- Beachhead: Singapore & Malaysia knowledge workers + SMEs on Windows.
- Expand: ASEAN bilingual teams; creator/productivity workflows; MSP channels.
- Why now: computer-use models matured; enterprises demand audit + human-in-the-loop.
- Why us: SEA language + governance + laptop-native UX designed together.

Business model

- Freemium desktop -> Pro subscription (STT, recipes, memory).
- Team/Business seats: shared audit ledger, approval policies, Cortex fleet brain.
- Pilot: setup + retainer for SME cohorts (FDE-assisted recipes & policy).
- Partners: MSPs, SWITCH ecosystem, creator-tool vendors (hands-and-eyes layer).
- Unit value: hours saved + compliance readiness vs brittle RPA projects.

Competition & moat

- vs Cloud operators (OpenAI/Anthropic): laptop-native, SEA-tuned, fail-closed.
- vs RPA (UiPath): natural language + vision recipes, not brittle selectors alone.
- vs Chat copilots: we click and type in real apps under approval - not advice only.
- vs Cloud dictation: on-device STT; mic/system audio stays privacy-first.
- Moat: governed action path + audit + local brain + multilingual edge speech.

Traction & readiness

- TRL 6: working Windows prototype - HUD, Frame, Clicky, driver, STT, approval gates,
- BRL 3: solution validation with early product surface; pre-revenue, founder-led.
- Funding: bootstrapped / no external raise yet; seeking SLINGSHOT visibility + partners
- IP: software IP and trade secrets in progress (governed screen-agent control + audit).
- Next: Singapore registration intent, design partners, first paying pilots.

The ask

- Join SLINGSHOT Top cohort to pitch at SWITCH and meet Singapore deep-tech partners
- Use grant + network to harden TRL toward commercial pilots in SG/MY.
- Design partners: Windows SME teams and creators who need governed desktop AI.
- Vision: every laptop gets a real AI coworker - powerful, trackable, human-approved.
